

Management, updated.

Operations from AllMax Software LLC

AllMax Software LLC has updated the Operator10® wastewater, Operator10® water, and Synexus™ Pretreatment applications.

Users should be aware of the following changes:

Features & Enhancements

- Added a copy button and clickable link to the report export confirmation.
- Print preferences are now saved per chart. These include margins, orientation, size, and header/footer.
- Modified the behavior of the OPC/DDE interface close and minimize buttons. Instead of closing the interface, the close button now minimizes it to the system tray. The minimize button minimizes as expected.
- Removed the OPC Core Components install prerequisite. This install is now only required if you are running the OPC/DDE Interface and will install when you launch that feature.

Operator10 wastewater

- Added a generic NetDMR report to the reporting section. This is a generic NetDMR report that is designed for any state that submits to the national NetDMR system.

Bug Fixes

- The Operator10 Agent log file no longer contains unnecessary repeating information.
- Scheduled database backups now delete after # of days/months.
- Security settings for Sampling Events now apply correctly.
- The FAC formula function now works across databases when using SQL Server.
- The copy button in the OPC/DDE Interface has been fixed.

Synexus pretreatment

- SNC reporting has been fixed for installs using a Pervasive PSQL database.
